

# Propositional Logic

January 11, 2019

---

## 1 Propositions

- A **Proposition** is an atomic statement that either has the truth value *true* or *false*
  - For example:
    - $1 + 1 = 2$
    - $1 + 2 = 4$
    - The Earth is closer to the Sun than Mars
    - My eyes are green
- 

## 2 Boolean Operators

- Negation
  - **Negation** is a unary boolean operator
  - This means it only takes one argument
  - The truth table for negation is:

$x$	$\neg x$
<i>true</i>	<i>false</i>
<i>false</i>	<i>true</i>

- Conjunction

- **Conjunction** is a binary boolean operator
- This means it takes two arguments
- The truth table for conjunction is:

$x$	$y$	$x \wedge y$
<i>false</i>	<i>false</i>	<i>false</i>
<i>false</i>	<i>true</i>	<i>false</i>
<i>true</i>	<i>false</i>	<i>false</i>
<i>true</i>	<i>true</i>	<i>true</i>

- Disjunction

- **Disjunction** is a binary boolean operator
- This is the truth table for disjunction:

$x$	$y$	$x \vee y$
<i>false</i>	<i>false</i>	<i>false</i>
<i>false</i>	<i>true</i>	<i>true</i>
<i>true</i>	<i>false</i>	<i>true</i>
<i>true</i>	<i>true</i>	<i>true</i>

- Exclusive-Or

- **Exclusive-or** is a binary boolean operator
- This is the truth table for exclusive-or

$x$	$y$	$x \oplus y$
<i>false</i>	<i>false</i>	<i>false</i>
<i>false</i>	<i>true</i>	<i>true</i>
<i>true</i>	<i>false</i>	<i>true</i>
<i>true</i>	<i>true</i>	<i>false</i>

- Implication

- **Implication** is a binary boolean operator
- $x \Rightarrow y$  means that when  $x$  is *true*,  $y$  is *true*, but  $y$  can be *true* when  $x$  is *false*
- This is the truth table for implication

$x$	$y$	$x \Rightarrow y$
<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>true</i>
<i>true</i>	<i>false</i>	<i>false</i>
<i>true</i>	<i>true</i>	<i>true</i>

- Equivalence

- **Equivalence** is a binary boolean operator
- This is the truth table for equivalence

$x$	$y$	$x \Leftrightarrow y$
<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>false</i>
<i>true</i>	<i>false</i>	<i>false</i>
<i>true</i>	<i>true</i>	<i>true</i>

- Nand

- **Nand** is a binary boolean operator
- It is the negation of conjunction
- This is the truth table for nand

$x$	$y$	$x \uparrow y$
<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>true</i>
<i>true</i>	<i>false</i>	<i>true</i>
<i>true</i>	<i>true</i>	<i>false</i>

- Nor

- **Nor** is a binary boolean operator
- It is the negation of disjunction
- This is the truth table for nor

$x$	$y$	$x \Downarrow y$
<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>true</i>
<i>true</i>	<i>false</i>	<i>true</i>
<i>true</i>	<i>true</i>	<i>false</i>

---

### 3 Boolean Formulae

- if  $P$  is the set of atomic propositions, a boolean formula  $bf$  can be derived from the following rules:
  - $bf ::= p$  where  $p \in P$
  - $bf ::= \neg bf$
  - $bf ::= bf \text{ op } bf$
  - $op ::= \wedge | \vee | \oplus | \Rightarrow | \Leftarrow | \Leftrightarrow | \Uparrow | \Downarrow$
- We will denote the set of boolean formulae defined by the above rule as  $F$

### 4 Ambiguity, Precedence and Associativity

- The previous rules by themselves are not sufficient to assign a single meaning to the following formula

$$p \Rightarrow q \Leftrightarrow \neg p \Leftrightarrow \neg q$$

We can represent this formula by at least two different trees

- When the same formula can have more than one meaning, the formula is *ambiguous*

- Ambiguity can be addressed by:
  - Using parentheses
  - Assigning *precedence* to the operators
  - assuming that operators *associate* from left to right
- The order of *precedence* from highest to lowest it:

$$\begin{array}{c}
 \neg \\
 \vee, \uparrow \\
 \wedge, \downarrow \\
 \Rightarrow \\
 \Leftrightarrow, \oplus
 \end{array}$$

So, now we have only one meaning for each of the following formulae

$$p \Rightarrow q \Leftrightarrow \neg p \Rightarrow \neg q$$

$$p \Rightarrow (q \Leftrightarrow \neg(p \Rightarrow \neg q))$$
